Halfround Light-Weight Drainage Channels

The strong and easy to handle drainage solution for underground mine levels

Advantages of light-weight Drainage Channels:

1. It is light-weight and easy to move from the store to the shaft and down the levels. With a weight of only 17 kg for a 1,2m length, one person can easily lift it. This makes handling and installation in limited spaces a simple matter.
2. Being reinforced with alkali resisting glass, it is strong enough to take the punch. It is more ductile than steel reinforced concrete, yet rigid enough to keep its shape.
3. It contains no steel and is not subject to corrosion, and deterioration following that.
4. Being cement based, it adheres to the cement slurry used for installation. It will not come loose like HDPE channels.
5. It contains no asbestos.

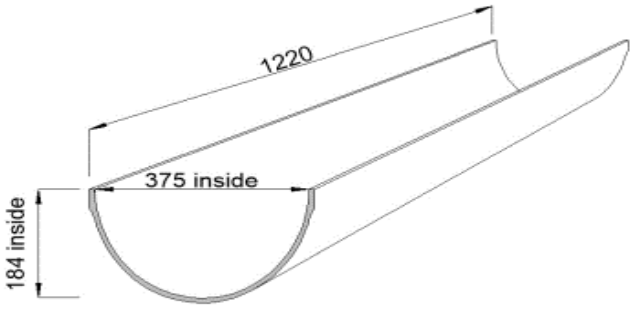

CROSS SECTION

Vanstone's Halfround light-weight drainage channel is ideal for installing in places where there is limited space and is difficult to access.

It was specially developed for mines where the channels are used to drain underground levels.

No machines for moving, lifting or placing are needed. All work can easily done by hand.

Packaging:
Channels are packaged on wooden pallets and wrapped for convenient handing by forklift around the store.
